### **Reasons for Allowance**

**1.**

With respect to Group 1 claims, the examiner concedes that Young teaches a single color  $C(j)$  after having sorted pixels from the least to the greatest, according to col. 9, lines 44-46. However, Young does not sort groups of pixels. It appears that Young only sorts one. The examiner concedes further that the pixels are not divided into groups but is comprised of a single group of pixels that range from the least to the greatest distance from the reference color  $C_r$ .

With respect to claim 38, the Group 2 claim, applicant alleges that Young does not teach defining a window having a predetermined size within an input color image. At col. 10, lines 29-33, Young teaches that a target of a color image is divided into sub-regions. Hence, the sub-regions are predetermined in size. But the claim is allowed for the reason that Young does not show that within the sub-region, selecting pixels having a similar color vector to that of the central pixel.
